The invention describes a composition comprising cDNA encoding fragments of human thrombospondin-1 (TSP -1), a type 1 repeat polypeptide and potent inhibitor of tumour growth and anglogenesis. The composition is useful for killing cancerous cells (preferably tumour); for reducing volume or inhibiting growth of a tumour (inhibiting neovascularisation the tumour); for decreasing proliferation of tumour cells; in the treatment of diseases and conditions associated with anglogenic activity or misregulated growth and anglogenesis-mediated diseases such as cancer, solid tumour, tumour metastasis, benign tumour, (e.g. haemangloma, acoustic neuromas, neurofibromas, trachomas, and pyogenic granulomas),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /label= Type_3_repeat_domain

rheumatoid arthritis, psoriasis, ocular angiogenic diseases (e.g. diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, necvascullar glaucoma, retrolental fibroplasias, rebeosis), Osler-Webber syndrome, myocardial angiogenesis, telangiectasia, plaque neovascularisation, haemophiliac joints, angiofibroma or wound granulation. The composition induces apoptosis and inhibits neovascularisation in the tumour cells. This amino acid sequence represents human thrombospondin-1 (TSP-1), on which the recombinant proteins of the invention are based
                                                                                                                                                                                                                                                                                                                                                                 Query Match

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C. I. FUNCTION: Adhesive glycoprotein that mediates cell-to-cell and cell-to-matrix interactions. Can bind to fibrinogen, fibronectin, call-to-matrix interactions. Can bind to fibrinogen, fibronectin, call-to-matrix interactions. Can bind to fibrinogen, fibronectin, call-to-matrix interactions. Can bind to fibrinogen. fibronectin, call-to-matrix alpha-V/beta-1. alpha-V/beta-1. alpha-V/beta-3 and alpha-III/beta-3. May play a role in dentinogenesis and/or maintenance of dentin and dental pulp.

C. I. SUBULAT: Homorrimer; disulfide-linked.

C. I. SIMILARITY: Contains 3 EGF-like domains.

C. SIMILARITY: Contains 1 TSP C-terminal (TSPN) domain.

C. SIMILARITY: Contains 7 TSP type-1 domains.

C. SIMILARITY: Contains 7 TSP type-1 domains.

C. SIMILARITY: Contains 7 TSP type-1 domains.

J. PROCTION: Adhesive glycoprotein that mediates cell-to-cell and cell-to-matrix interactions. Can bind to fibrinogen, fibronectin,
I aminin, type V collagen and integrins alpha-V/beta-1, alpha-V/beta-3 and alpha-IIb/beta-3.

Cell-to-matrix: Collagen and integrins alpha-V/beta-1, alpha-V/beta-3 and alpha-IIb/beta-3.

Cell-to-matrix: Contains 1 TSP C-terminal (TSPC) domain.

SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.

SIMILARITY: Contains 7 TSP type-1 domains.

SIMILARITY: Contains 7 TSP type-1 domains.

SIMILARITY: Contains 7 TSP type-1 domains.

Cell-to-matrix interactions. Can bind to fibrinogen, fibronectin, laminin, type V collagen and integrins alpha-V/beta-1, alpha-V/beta-3 and alpha-IID/beta-3.
Cell-to-matrix: and alpha-IID/beta-3.
Cell-to-matrix: contains 3 EGP-like domains.
Cell-to-matrix: Contains 3 EGP-like domains.
Cell-to-matrix: Contains 3 TSP type-1 domains.
Cell-to-matrix: Contains 7 TSP type-1 domains.
Cell-to-matrix: Cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Copyrighted by the UniProt Consortium, see http://www.uniprot.org/terms Distributed under the Creative Commons Attribution-NoDerivs License

FORENTEAL INFORMATION:

APPLICANT: Homburger et al.

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster;

FILE REFERENCE: FILE Reference: 7326-094

CURRENT APPLICATION NUMBER: US/09/270, 767

CURRENT APPLICATION NUMBER: US/09/270, 767

CURRENT FILING DATE: 1999-03-17

SOFTWARE: PatentIN Ver. 2.0

SEQ 1D NO 61396

LENGTH: 61

New peptides that bind to or are recognized by alpha3-beta1 integrins, useful for inhibiting cell adhesion to extracellular matrix, cell motility and proliferation and for treating rheumatoid arthritis and cancer.

Claim 4; Page 34; 84pp; English.

The present invention provides a number of peptides which bind to alphaibetal integrins. They are useful in the modulation of cell adhesion and motility, and in the treatment of cancer, diabetic retinopathy, rheumatoid arthritis, macular degeneration, atherosclerosis, psoriasis and restenosis. The present sequence is an example of one of the peptides of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides a number of peptides which bind to alpha3betal integrins. They are useful in the modulation of cell adhesion and motility, and in the treatment of cancer, diabetic retinopathy, rheumatoid arthritis, macular degeneration, atherosclerosis, psoriasis and restenosis. The present sequence is an example of one of the peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

They are useful in the modulation of cell adhesion and motility, and in the treatment of cancer, diabetic retinopathy, rheumatoid archritis, macular degeneration, atherosclerosis, psoriasis and restenosis. The present sequence is an example of one of the peptides
Alpha3beta1 integrin; angiogenesis; cell proliferation; cancer; diabetic retinopathy; restenosis; atherosclerosis; rheumatoid arthritis; macular degeneration; psoriasis; cell adhesion; cell motility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Alpha3betal integrin; angiogenesis; cell proliferation; cancer; diabetic retinopathy; restenosis; atherosclerosis; rheumatoid arthritis; macular degeneration; psoriasis; cell adhesion; cell motility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New peptides that bind to or are recognized by alpha3-beta1 integrins, useful for inhibiting cell adhesion to extracellular matrix, cell motility and proliferation and for treating rheumatoid arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 12;

                                                                                                                                                                          The present invention provides a number of peptides which bind to alphaiberal integrins. They are useful in the modulation of cell adhesion and motility, and in the treatment of cancer, diabetic retinopathy, rheumatoid archritis, macular degeneration, atherosclerosis, psoriasis and restenosis. The present sequence is an example of one of the peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to diagnosing cancer other than prostate cancer in a male mammal, comprising assaying a test sample for increased level of semenogelin, or cancer in a female by assaying for the presence of semenogelin. Administering a semenogelin protein or polypeptide fragment or a semenogelin-specific antibody or active fragment, or a recombinant or expressing the protein or antibody, is useful for inducing an immune response to a cancer in a mammal, where the cancer is not prostate cancer and semenogelin is a marker. The invention is used to diagnose cancer, particularly of epithelial origin such as lung cancer, papillary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A new diagnosis for cancer other than prostate cancer in a mammal useful to detect cancer including lung cancer, particularly small cell lung cancer and melanoma comprises detecting semenogelin in a sample.
                                              New peptides that bind to or are recognized by alpha3-betal integrins, useful for inhibiting cell adhesion to extracellular matrix, cell motility and proliferation and for treating rheumatoid arthritis and
                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; thrombospondin-1; cytostatic; immunostimulant; cancer; epithelial cancer; lung cancer; papillary renal cell carcinoma; colon cancer; small-cell lung cancer; SCLC; melanoma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of the N-terminal domain of human thrombospondin-1 (TSP) ADL/10639. The invention relates to TSP fragments (80-100, 40-55 or 20-35 kDa mol.wt.) found in plasma, and their use in clinical assays for cancer and for generation of antibodies and other binding agents. A method that distinguishes TSP from a TSP fragment or portion involves: (1) using an epitope shared by TSP and the TSP fragment or portion as a target for a binding molecule, e.g. an antibody, to obtain a quantitation of TSP plus TSP fragment or portion, (2) using an epitope present in TSP but not in the fragment or portion to obtain a quantitation of TSP only; and (3) using the difference between (1) and (2) as a quantitation of the amount of TSP fragment or portion. Suitable epitopes are provided ADL/1063-ADL/10639. Detection or quantification of the TSP fragment or portion as performed in order to detect the presence, or monitor the course, of a disease or condition selected from cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nsefnl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New purified thrombospondin fragment extracted from a body fluid, useful for diagnosing cancer e.g. adenoma, adenocarcinoma, carcinoma, lymphoma or leukemia or as calibrators, indicators, immunogens and analytes.
renal cell carcinoma, colon cancer, especially small-cell lung cancer (SCLC), or a melanoma. The present sequence represents the amino acid sequence of the thrombospondin-1 sequence containing synthetic peptide which binds to alpha-3-beta-1 integrin
                                                                                                                                                                        Gaps

The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The invention altered risk for myocardial infarction in the individual. The invention current comprises: an isolated nucleotides of an SNP given in the specification or its complement and encoding any one of the amino acid sequences given in the specification, an isolated polypeptide comprising an amino acid sequence given in the specification, an antibody that specification and which is between about 16 and 1000 nucleotides in capacity; a kit for detecting an SNP in a nucleic acid molecule, a method of detecting an SNP in a nucleic acid molecule; an entryme; a method of detecting an SNP in a nucleic acid molecule; an entryme; and a propertion or transporting an SNP in a nucleic acid molecule; an entryme; and a variant polypopptide; and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   composition for treating or preventing myocardial infarction. This sequence represents the protein of a human myocardial infarction-sescoiated gene containing one or more SNPs of the invention. Note: This sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human myocardial infarction-associated gene derived protein, SEQ ID 1020.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            method for identifying an agent useful in treating or preventing myocardial infarction. The novel detection method has cardiant activity. The nucleic acids of the invention may be used in gene therapy. The method is useful in identifying an individual who has an increased or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        decreased risk for developing myocardial infarction and for preparing a

The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's callered risk for myocardial infarction in the individual. The intention further comprises: an isolated nucleic acid molecule comprising at least sontiguous nucleotides where one of the nucleotides is an SNP given in the specification or its complement and encoding any one of the amino acid sequences given in the specification; an isolated polypeptide comprising an amino acid sequence given in the specification, an antibody fragment; an amplified polymorleotide containing an SNP given in the specification and which is between about 16 and 1000 nucleotides in length; a kit for detecting an SNP in a nucleic acid molecule; a method of detecting an SNP in a nucleic acid molecule; a method of detecting a veriant polypeptide; and a mucleic acid molecule; a method of detecting a veriant polypeptide; and a mucleic acid molecule; a method of detecting a veriant polypeptide; and comprising the molecule; a method of detecting a veriant polypeptide; and a mucleic acid molecule; a method of detecting a veriant polypeptide; and comprising the molecule; and indentifying an apent useful in treating or preventing method is useful in identifying an individual who has an increased or decreased risk for developing myocardial infarction, may be used in gene therapy. The commodition for the invention may be used in gene therapy. The commodition for the invention may be used in gene therapy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               composition for treating or preventing myocardial infarction. This sequence represents the protein of a human myocardial infarction-sequence containing one or more SNP s of the invention. Note: This sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      granulocyte colony stimulating factor receptor; glucagon; hypertrophy; platelet-derived endochelial cell growth factor; cardiovascular disease; cellular tumour antigen PS3; cyclin-dependent kinase inhibitor 1C; vasoactive intestinal polypeptide receptor 2; arteriosclerosis; cancer; myocardial infarction; coronary arterial thrombosis; renal disease; diabetic nephropathy; muscular disease; immune disorder; sarcoidosis; nonarcoidotto pulmonary granulomatous disease; endothelial abnormality; vascular disorder; asbestosis.
                                                                                                                                                                                                              Identifying an individual who has an altered risk for developing myocardial infarction by detecting a single nucleotide polymorphism in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Angiotensin converting enzyme splice variant; ACEV; interleukin 6;

The sequence represents an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of garanlocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumour antigen PS3, and vasoactive intestinal polypeptide receptor 2. The polypeptides and their associated nucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                disorders including cardiovascular diseases such as arteriosclerosis, mycoardial infarction and coronary arterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertrophy; immune disorders such as immune complex nephritis, multiple sclerosis, cancer, astroidosis, nonarcoidotic pulmonary granulomatous diseases such as asbestosis and vascular pathologies involving an endothelial abnormality such as deep vein thrombosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel alternative splicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; cancer associated gene; cancer antigen; detection; cancer; diagnosis; cytostatic; proliferative; vulnerary; immunomodulator; antishmatic; antishmentic; cantiborateria; nootropic; vasotropic; antipsoriatic; antiangiogenic; gene therapy; inflammation; immune disorder; haemacopoietic cell disorder; autoimmune disorder; allegic reaction; graft versus host disease; organ rejection; haemostatic; thrombolytic; cardiovascular disorder; infection; neurological disease; drug screening.

The mostropic; vasotropic; antiposoriatic and antiangiogenic. The polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune rejection, modulate haemostatic or thrombolytic activity, modulate rejection, concers, cardiovascular disorders, neurological disease and inflammation, cancers, cardiovascular disorders, neurological disease and agonists and antagonists may be also be used in drug screens. AAC78449 to AAC78457 and AAB44240 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence represents an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumour antigen P53, and vasoactive intestinal polypeptide receptor 2. The polypeptides and their associated nucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    disorders including cardiovascular diseases such as arteriosclerosis, myocardial infarction and coronary arterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertrophy, immune disorders such as immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidotic pulmonary granulomatous diseases such as asbestosis and vascular pathologies involving an endothelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel alternative splicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies.
multiple sclerosis; immune complex nephritis; deep vein thrombosis; nonarcoidotic pulmonary granulomatous disease; endothelial abnormality; vascular disorder; asbestosis.

```
mediated anti-neoplastic composition is prepared through cloning the cDNA sequence from the human peripheral blood cell by specific primer and reverse transcription-polymerase chain reaction (RT-PCR) method for coding TSF polypeptide, construction in human embryonic kidney cell 293 by AdEasy system, and packaging and expressing the recombinant adenovirus vector of TSF. It can suppress the growth and transfer of cancer. The present sequence represents the TSF polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Angiotensin converting enzyme splice variant; ACEV; interleukin 6; granulocyte colony stimulating factor receptor; glucagon; hypertrophy; platelet-derived endothelial cell growth factor; cardiovascular disease; cellular tumour antigen P53; cyclin-dependent kinase inhibitor IC; vasoactive intestinal polypeptide receptor 2; arteriosclerosis, cancer; myocardial infarction; coronary arterial thrombosis; renal disease; diabetic nephropathy; muscular disease; immune disorder; sarcoidosis; multiple sclerosis; immune complex nephritis; deep vein thrombosis; nonarcoidotic pulmonary granulomatous disease; endothelial abnormality; vascular disorder; asbestosis.
                                                                                                                                                                                                                                                                   The present invention relates to a novel recombinant adenovirus vector
                                                                                                                                                                                                Tumor suppressing polypeptide TSF and gene therapy vector composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Angiotensin converting enzyme (ACEV) splice variant protein #14.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The sequence represents an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumour antigen PS3, and vasoactive intestinal colypeptides receptor 2. The polypeptides and their associated nucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various associated infarction and coronary arterial thrombosis, renal diseases cuch as diabetic nephropathy, muscular diseases such as hypertrophy, immune disorders such as immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidotic pulmonary granulomatous diseases such as asbestosis and vascular thrombosis as asbestosis and vascular thrombosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Angiotensin converting enzyme splice variant; ACEV; interleukin 6; granulocyte colony stimulating factor receptor; glucagon; hypertrophy; platelet-derived endothelial cell growth factor; cardiovascular disease; cellular tumour antigen P53; cyclin-dependent kinase inhibitor IC; vasoactive intestinal polypeptide receptor 2; arteriosclerosis; cancer; myocardial infarction; coronary arterial thrombosis; renal disease; multiple sclerosis; immune disorder; sarcoidosis; nultiple sclerosis; immune complex nephritis; deep vein thrombosis; nonarcoidotic pulmonary granulomatous disease; endothelial abnormality; vascular disorder; asbestosis.
                                Novel alternative splicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Angiotensin converting enzyme (ACEV) splice variant protein #13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                     The sequence represents an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumour antigen P53, and vasoactive intestinal apolypeptide receptor 2. The polypeptides and their associated nucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various disorders including cardiovascular diseases such as arteriosclerosis, myocardial infarction and coronary arterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertrophy.
                                                                                                                                                                                                                                                                                                                                                     immune disorders such as immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidotic pulmonary granulomatous diseases such as asbestosis and vascular pathologies involving an endothelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TSP-1; TSP-2; COMP; cartilage oligomeric matrix protein; thrombospondin; angiogenesis; tumour; treatment; cancer; arthritis; psoriasis; diabetic retinopathy; corneal graft rejection; glaucoma.
                               Novel alternative splicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies.
